
Reference: PDSN12#H
Patch: SmartNotification 1.2 patch H (cumulative)
WABConvert 1.0 Build 1.0.0
Date: 2012-02-25

Patch #H (build 1.2.15, 2012-02-25)

Internal messages

- Viewer for internal messages improved. Severities are now coloured.

Registration / License handling

- Fix: Temporary MAC addresses (Wireless and virtual networks) could cause the license module to request a new license.
- On the Registration dialog, the full path/filename of the license file can now be seen as a tooltip when hovering over the license file textbox.

Smart Shared folder

- Fix: SmartShared folder was expected to be available for license registration. SmartNotification now initializes the SmartShared folder if it is missing.

Shared resources

- Menu item for showing settings shared between all Smart* applications added.

Windows 7 support

- Windows Address Book is not supported by Windows 7. The address book has therefore been replaced by a new module for handling contacts and related information. Existing WAB files must be converted using the WabConvert.exe tool, which is enclosed in the patch archive.

Patch #G (build 1.2.14, 2010-10-06)

License registration

- Support for new file based license system. Dongles and license key registrations are no longer supported.

Trace messages

- Socket trace messages made more informative.

Patch #F (build 1.2.13, 2009-04-12)

SMTP communication (mail)

- In rare cases a deadlock with the SMTP server could occur; causing the SmartNotification to stop sending mail notifications.

Add notification

- When adding a new EXE notification an error message was shown.
